Phase 4 Evidence before complexity

KGI CU league | 30 October 2026 | TradeSim 0.2.7

1/7 compared portfolios pass the common criteria. No candidate is promoted. The declared development comparisons are complete; independent chronological validation remains blocked.

P-C3, equal weights in the C3 basket, has common status pass: 10 completed lots and THB 189.26 expected payoff. Its net return is -3.352153%, versus R76 at -3.245602%. It fails Best Alpha and does not beat R76.

Phase 4 is not fully complete. The engineering, diagnostics and declared September experiments are complete. No additional permitted tick period or effective-dated membership is available, so the validation checkpoint cannot be certified. The original reference remains the fallback; entry into Phase 5 is not a claim of validated alpha.

Seven portfolios: the 76% reference, C2/C3 and four predeclared controls. The original 70% reference remains historical context. All results are development evidence.

Results and eligibility

ID	Net %	Excess pp	MaxDD %	Exposure %	FIFO	Payoff THB
R76	-3.246	0.854	3.149	75.691	0	Undefined
C2	-3.710	0.389	3.718	74.668	5	-977.95
P-C2	-3.612	0.487	3.752	75.011	1	78.59
C3	-3.590	0.510	4.310	74.154	34	-603.88
P-C3	-3.352	0.747	3.949	74.671	10	189.26
H-C3	-3.379	0.721	4.101	75.951	0	Undefined
B-C3	-3.595	0.504	4.316	75.808	20	-393.04

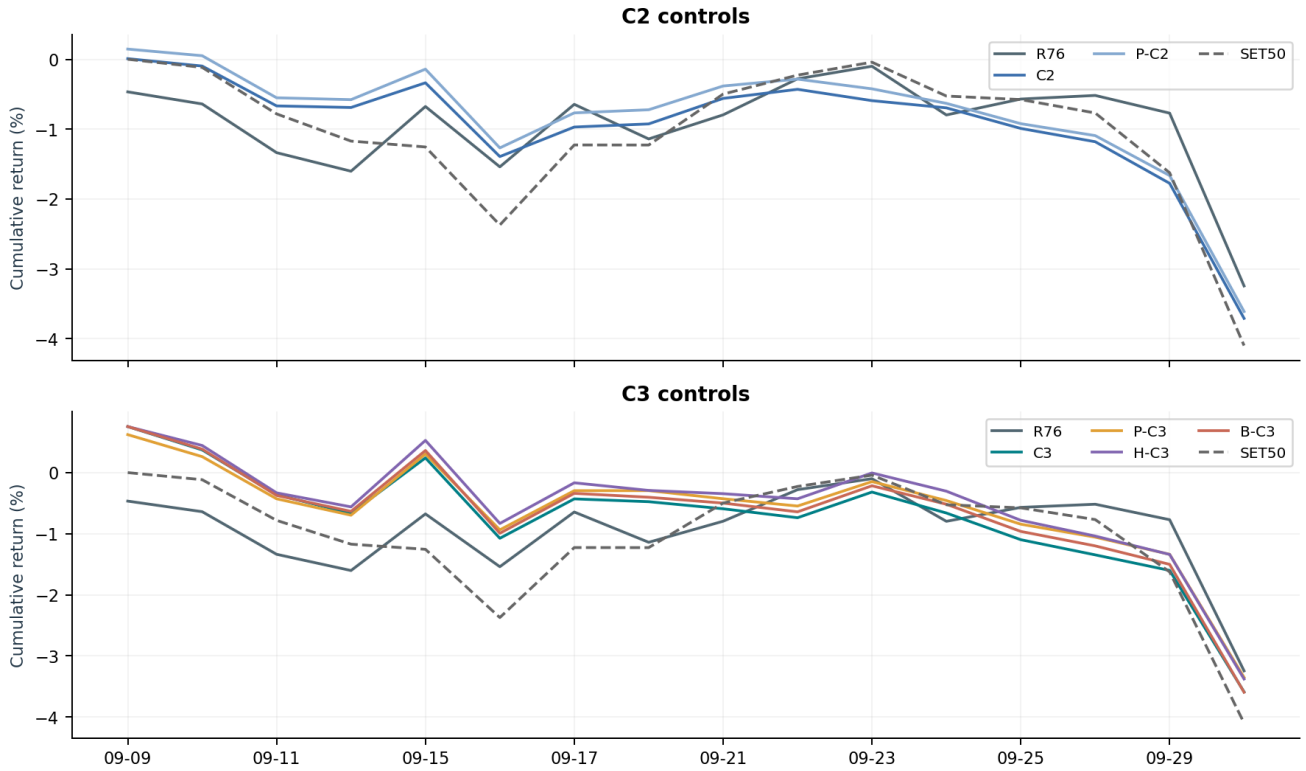

ID	Common	Best Alpha	Aligned excess pp	Initial-capital DD %
R76	fail	fail	1.308	3.246
C2	fail	fail	0.381	3.718
P-C2	fail	fail	0.347	3.752
C3	fail	fail	-0.211	4.310
P-C3	pass	fail	0.150	3.949
H-C3	fail	fail	-0.002	4.101
B-C3	fail	fail	-0.217	4.316

The benchmark returned -4.099496%, with 4.099496% maximum drawdown. Portfolio drawdown must be strictly below 6.149244%. All portfolios trade ten distinct names. Common criteria require at least five completed lots, at least 50% average exposure, positive payoff and the drawdown test. Best Alpha adds nonnegative total and excess return.

The user exposure preference is 70-80%. Undefined payoff means there are no completed non-flat lots; it is not zero profit. Completed FIFO lots are not independent investment decisions.

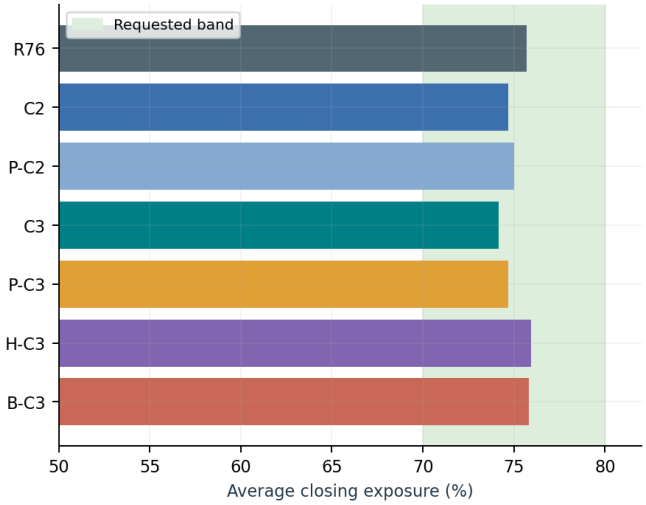

The original 70%-target reference returned -2.991564% at 69.693722% average exposure. R76 changes net return by -0.254039 pp. The original remains the engineering fallback; neither reference has completed-lot payoff evidence.

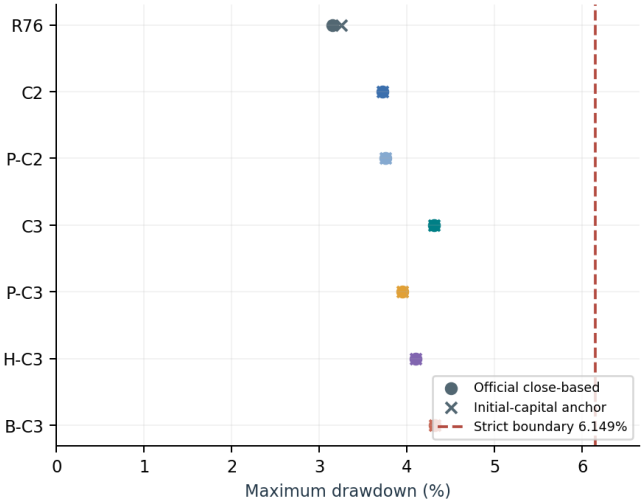

Daily return paths

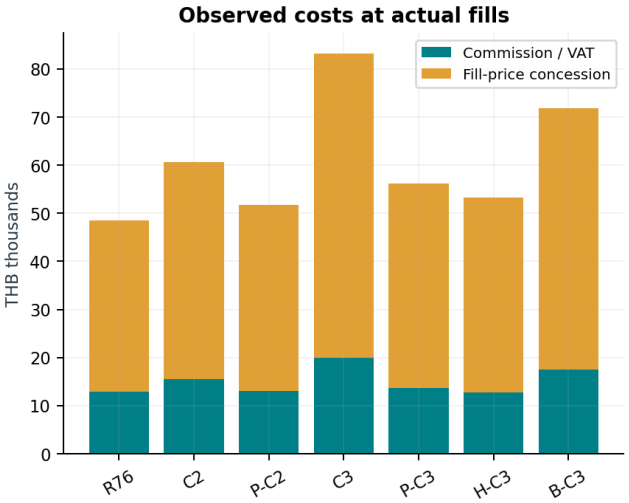

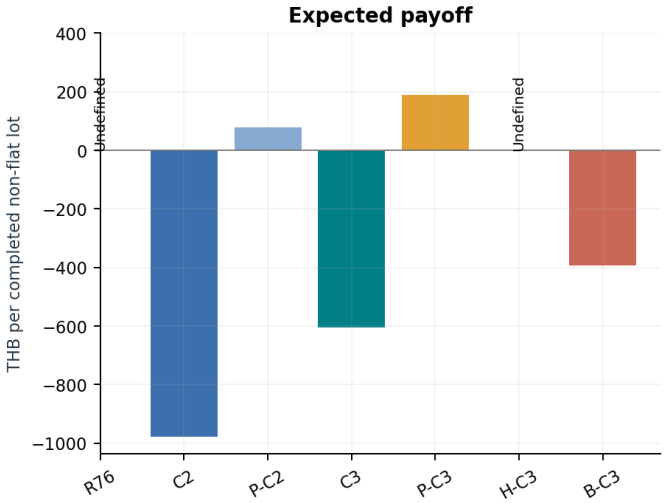

All portfolios receive the same 2,906,167 ticks, 16 sessions and costs in notebook symbol/row-index order. Portfolio and benchmark initial anchors differ; use the aligned metrics alongside official results. Cross-symbol marks are not synchronized.

Risk, exposure and trading costs

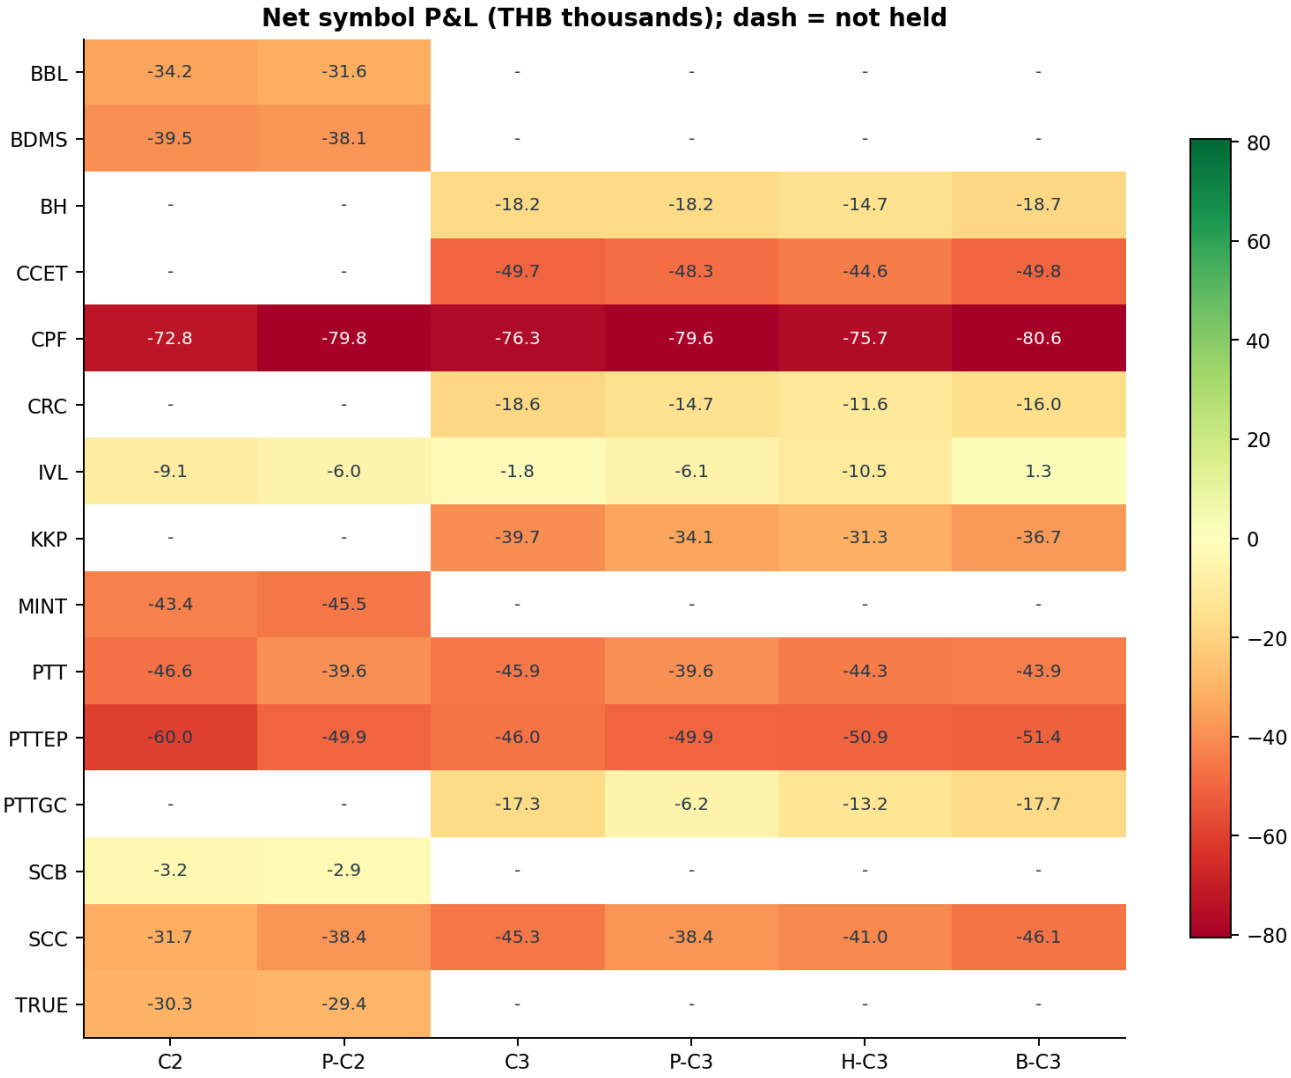

Drawdown uses daily closes; it does not describe intraday troughs. The passive control deliberately omits the daily de-risking guard. Costs here are observed commission/VAT and adverse price ticks, not a fitted transaction-cost model.

Where the losses occurred

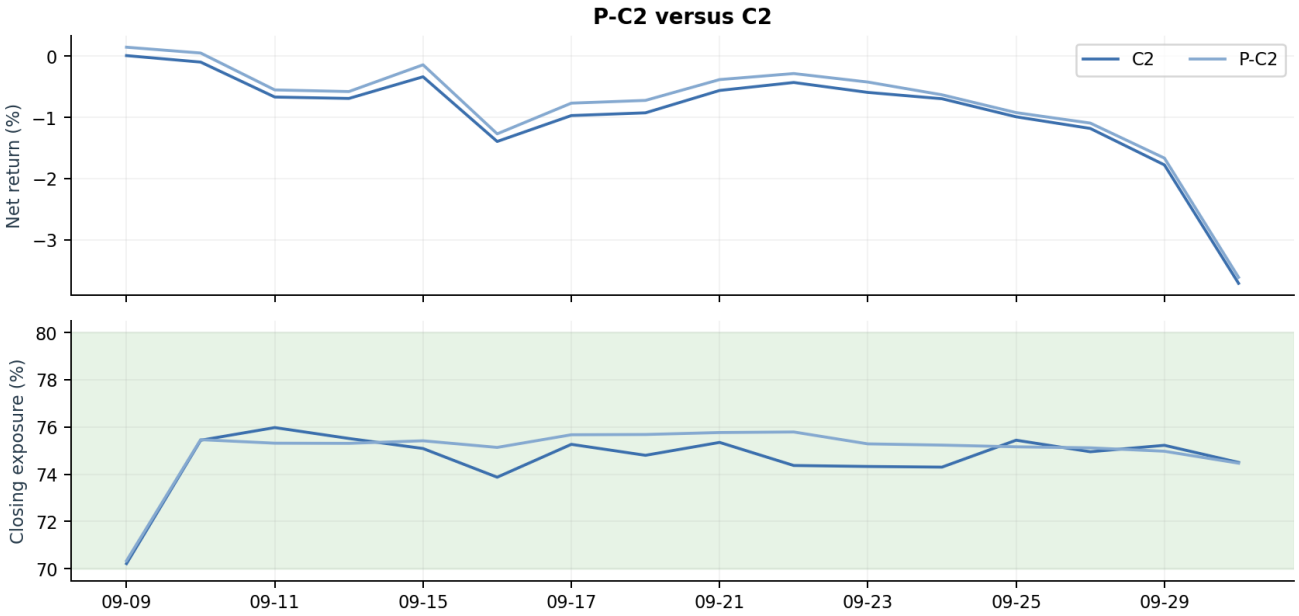

Every cell includes realized and unrealized P&L after costs. A dash means the symbol was not held. Symbol totals reconcile to portfolio P&L; the CSV/JSON keep the full attribution and completed-lot outcomes.

P-C2: C2 basket, equal weights

Replace daily ranked weights with equal weights in the same C2 basket; retain the guard and execution rules.

Metric	Value	Metric	Value
Net return	-3.612%	Average exposure	75.011%
Official drawdown	3.752%	SET50 excess	0.487 pp
Completed lots	1	Expected payoff	78.59 THB
Realized P&L	3,453.39	Unrealized P&L	-364,654.81

Net return change versus C2: +0.097983 pp; average exposure change: +0.342622 pp; commission/VAT change: THB -2,388.35. Decision: retain as development hypothesis only. No promotion.

The basket, initial capital, cost model and execution order match the paired reference. Guard triggers can differ as portfolio paths diverge; this is part of the resulting behavior.

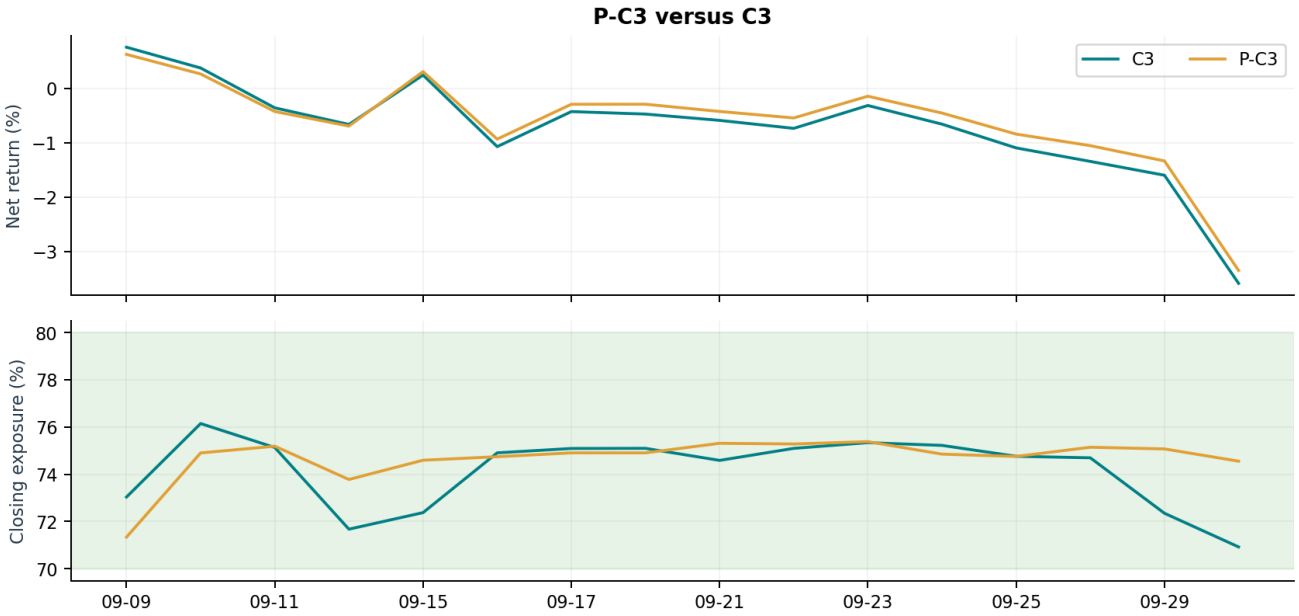

Guard days: normal: 16. Maximum local daily runtime: 23.734s.

P-C3: C3 basket, equal weights

Replace daily ranked weights with equal weights in the same C3 basket; retain the guard and execution rules.

Metric	Value	Metric	Value
Net return	-3.352%	Average exposure	74.671%
Official drawdown	3.949%	SET50 excess	0.747 pp
Completed lots	10	Expected payoff	189.26 THB
Realized P&L	2,821.12	Unrealized P&L	-338,036.41

Net return change versus C3: +0.237349 pp; average exposure change: +0.517373 pp; commission/VAT change: THB -6,214.90. Decision: retain as development hypothesis only. No promotion.

The basket, initial capital, cost model and execution order match the paired reference. Guard triggers can differ as portfolio paths diverge; this is part of the resulting behavior.

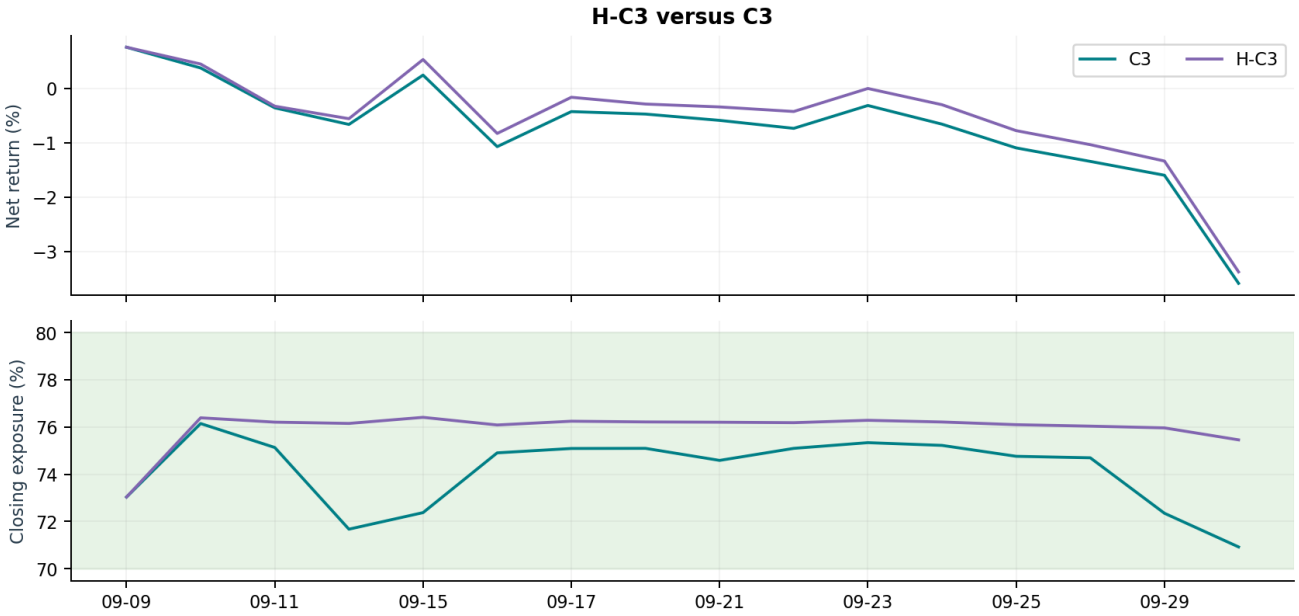

Guard days: normal: 15, soft_drawdown: 1. Maximum local daily runtime: 19.753s.

H-C3: C3 initial quantities, passive

Freeze C3 initial quantities from pre-start features. Retry residual initial buys; do not sell or apply later daily de-risking.

Metric	Value	Metric	Value
Net return	-3.379%	Average exposure	75.951%
Official drawdown	4.101%	SET50 excess	0.721 pp
Completed lots	0	Expected payoff	Undefined THB
Realized P&L	0.00	Unrealized P&L	-337,869.16

Net return change versus C3: +0.210810 pp; average exposure change: +1.797387 pp; commission/VAT change: THB -7,111.03. Decision: retain as development hypothesis only. No promotion.

The passive comparison changes both ongoing allocation and the guard. It cannot isolate the value of reranking alone. No terminal sales were forced.

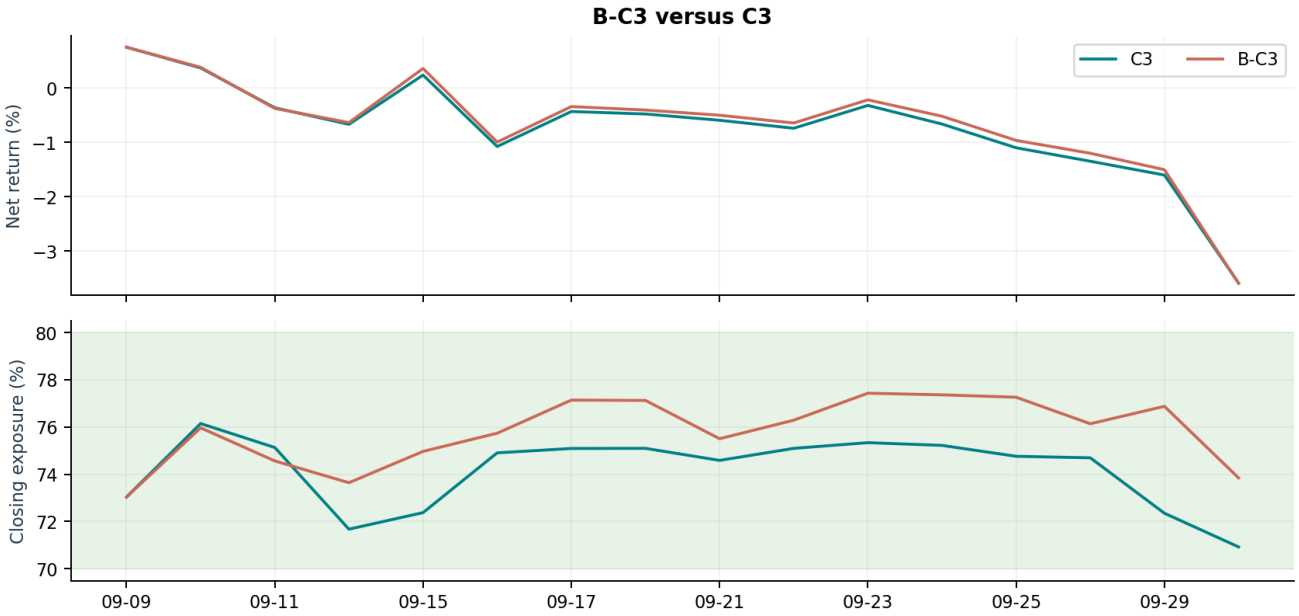

Guard days: passive_fixed_quantities: 16. Maximum local daily runtime: 19.286s.

B-C3: C3 with 0.8% rebalance band

Widen only the C3 rebalance activation band from 0.4% to 0.8% of opening NAV; continue actual residual fills once active.

Metric	Value	Metric	Value
Net return	-3.595%	Average exposure	75.808%
Official drawdown	4.316%	SET50 excess	0.504 pp
Completed lots	20	Expected payoff	-393.04 THB
Realized P&L	-22,733.17	Unrealized P&L	-336,799.51

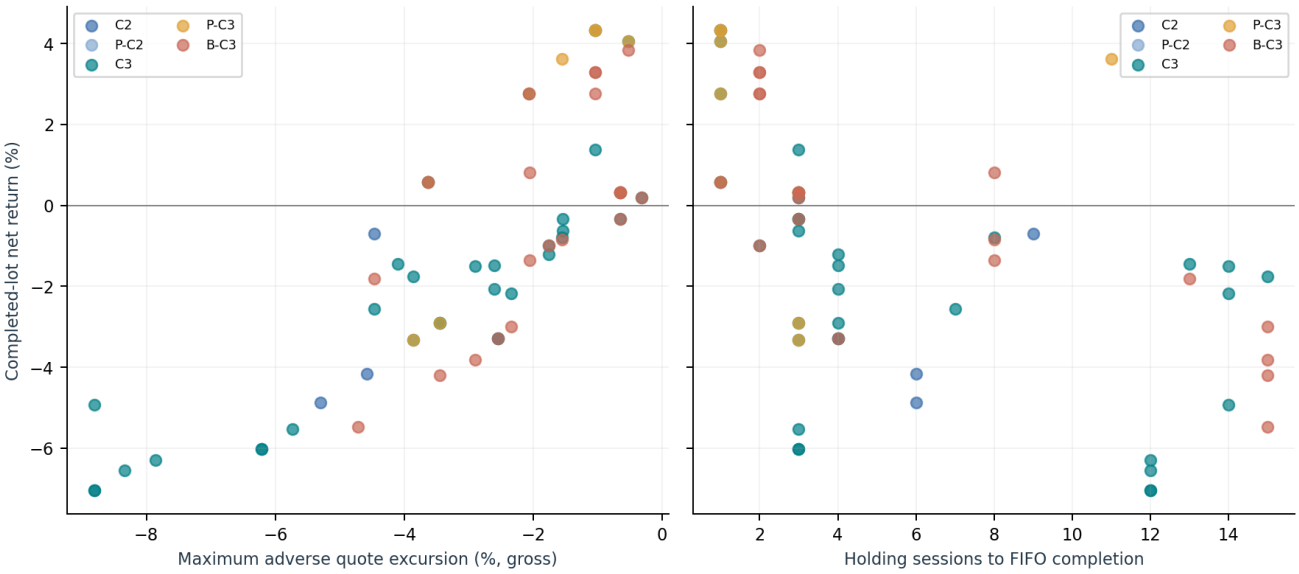

Net return change versus C3: -0.005825 pp; average exposure change: +1.653692 pp; commission/VAT change: THB -2,367.52. Decision: reject change on current development evidence. No promotion.

The basket, initial capital, cost model and execution order match the paired reference. Guard triggers can differ as portfolio paths diverge; this is part of the resulting behavior.

Guard days: normal: 14, soft_drawdown: 2. Maximum local daily runtime: 21.447s.

Completed lots: price paths and holding horizons

Each dot is one completed FIFO buy lot, not an independent investment idea. Quote MAE/MFE use the first buy through final close, relative to the gross average buy fill price. Known entry/exit quotes and strictly interior timestamps exclude ambiguous other ticks at the same boundary times. Quotes include auctions; commissions, exit slippage and shrinking quantities after partial sales are not modeled by this path measure. This is retrospective diagnosis, never a strategy input or an executable liquidation return. Still-open lots are excluded.

A positive payoff on completed lots can coexist with a negative portfolio return because most loss may remain unrealized. Compare realized and unrealized P&L and the symbol heatmap before drawing an entry-quality conclusion.

Verification, boundaries and phase status

86 tests pass. All 90 deterministic artifacts from ten restored Phase 3 runs match their committed hashes. The research copy passes a two-day parity check for five behavioral artifacts and all performance metrics. All 112 strategy-days in this seven-portfolio comparison reconcile; the official package and Phase 3 reference sources remain unchanged.

Phase 4 is not fully complete. The engineering, diagnostics and declared September experiments are complete. No additional permitted tick period or effective-dated membership is available, so the validation checkpoint cannot be certified. The original reference remains the fallback; entry into Phase 5 is not a claim of validated alpha.

The September sample has been repeatedly inspected. Parameter changes and rankings here do not establish out-of-sample expectancy. Validation and final evaluation periods remain unassigned until additional permitted ticks and effective-dated membership are supplied. The static 48-stock universe cannot establish historical membership.

The declared 15-name expansion is blocked on its membership requirement. Actual replay sensitivity to costs/lookbacks/liquidity is a final-selection task; no qualified candidate is available to freeze. Fixed-fill fee stresses of +25% and +50% remain diagnostic arithmetic and are saved in JSON.

Portfolio intraday drawdown, production event ordering, restart durability, registered owner and organizer acceptance remain unresolved. Completed-lot quote excursions do not resolve those questions. Local runtime is measured, not a production guarantee.

Handoff: what is finished and what comes next

Status	Action / evidence
Completed	Archive recovery; engine tests; 90-artifact reproduction; symbol/FIFO/cost diagnostics; R76 and four declared controls; visual report and retained outcomes.
Blocked Phase 4 work	Obtain permitted additional tick periods, effective-dated membership and adjustment/publication semantics; declare chronological development/validation/final periods before inspecting results.
Decision	Keep the original engineering reference. Retain only explicitly labeled development hypotheses; no qualified or robustly profitable candidate is established.
Before candidate promotion	Validate a frozen candidate against R76 and its paired control, positive payoff/common criteria and 70-80% exposure. If evidence fails, revise the hypothesis and retain the fallback.
Phase 5 continuation	The guide permits work from a retained baseline. Keep the original fallback and P-C3 as a research comparator; study sizing, guard recovery, concentration drift and turnover. Phase 4 validation stays open.

Continue from docs/current-progress/README.md and docs/to-do/README.md. Frozen declarations are in research/phase4/ and research/phase4-controls/configs/. Full logs, exact strategy/config bundles and raw fills are in ignored artifacts/.
